

Table of contents

	THE WIND, HOW AND WHY ?	
1	THE GENERAL WIND : ORIGIN AND FORECASTS.....	11
	1.1 The synoptic wind, gradient wind.....	12
	1.2 Forecasting the wind.....	13
	1.3 The jet-streams.....	15
	1.4 Omega shape: flows pulled and flows pushed.....	18
	1.5 Where to find wind forecasts?.....	20
2	LOCAL WINDS OF THERMAL ORIGIN: VALLEY BREEZE AND CONVERGENCES.	23
	2.1 Formation of Convergence fronts.....	24
	2.2 Using Convergences.	25
	In the Alps	26
	In central Italy.	29
	In the Andean Cordillera.	40
3	SLOPE SOARING, TECHNIQUES AND TIPS	43
	History: USA Pioneer of slope flying long distances: Karl Striedieck. The first in Europe : Wolfgang Janowitsch et Hermann Trimmel (Austria). Today: Mathias Schunk and Alberto Sironi.	
	3.1 The verticality of the wall, the horizontal component of wind	51
	3.2 Wind gradient along the slope.	56
	3.3 How fast to fly along the slopes?	56
	3.4 The orientation of the ridge line relative to the wind.	58
	3.5 The accelerators of flow: concavity or convexity.	59
	3.6 Note on Right of way while slope soaring	60
	3.7 Presence of another slope upwind capable of creating a phase opposition.	60
4	SLOPE FLYING, THE REAL DANGERS	61
	4.1 Blind corners, Collision danger	62
	4.2 The limits of authority of the roll control.	63
	4.3 The hillside death trap of the thermal under the outer wing.	65
	4.4 Deceptive Plateaus.....	66
	4.5 "Cap" Clouds.....	68
	4.6 Morning and Evening Oblique Light	78
	4.7 Cables.....	82
	4.8 The loss of lift due to vegetation.....	84
	4.9 Crossing a ridge downwind (variometer anomalies).....	86
	4.10 Crossing of a col from the leeward side	86
	4.11 Wind rotation by the mountains: dextrorotatory or levorotatory.....	88
5	THEORIES ON THE FORMATION OF WAVES	93
	5.1 Background theoretical studies and experiments on atmospheric waves.	95
	5.2 Physical mechanisms at the origin of the formation of atmospheric waves.....	99
	5.3 Continuity of wave motion in the vertical plane, Richard Scorer. In conclusion.	111

6	ATYPICAL WAVES	119
6.1	Inversion wave and wind gradient wave (Progressing wave)	120
6.2	Convective Wave	120
6.3	Cold Front Wave	121
6.4	Thermo-wave	122
6.5	Wake waves from isolated mountains.	125
7	THE HYDRAULIC JUMP (Bidone's jump)	133
7.1	Introduction to Giorgio Bidone and his "salto" (jump).	134
7.2	Introduction to Froude and the meteorology of mountains.	136
7.3	Atmospheric evidence and how to use it.	137
7.4	Jump induced by orography, in a valley downwind of a mountain.	140
7.5	The jump induced by a gap in the mountains or local absence of relief, local supercritical flows ..	148
7.6	Typical situations in Europe and exploitation.	152
7.7	Concluding Notes	158
8	IDENTIFICATION AND SPECIFIC TECHNIQUES TO USE LEE WAVES.	161
8.1	Wave in the presence of thermals, isolated downwind cumulus... ..	162
8.2	Wave in the presence of thermals, cumulus aligned on the crests.	163
8.3	Wave in the presence of thermals, a layer of cumulus	165
8.4	Wave in the presence of thermals, cumulus at two bases (confluence, convergence) . . .	166
8.5	Flying downwind of ridges not perpendicular to the wind	167
8.6	When the slope is not in phase with the lee-wave rebound.	169
8.7	Negative wind gradient, rotors appearing to turn backwards.	171
8.8	Migratory Rotors.	174
8.9	Steepness of a downwind wall.	177
9	DETERMINATION OF SPEEDS TO FLY AND LIMITATIONS.	181
9.1	Best glide speed intowind.	182
9.2	Best glide speed downwind	183
9.3	Optimising the cross country speed in the presence of lift	184
9.4	Influence of wing loading	185
9.5	Direct influence of altitude	186
9.6	Indirect influence of altitude	187
9.7	Choosing the speed-to-fly	188
9.8	Final Table	190
9.9	Structural Limitations	192
9.10	Airspeed Indicator (ASI) Errors	202
9.11	Variometric errors	205
9.12	Glider Selection and Preparation.	206
9.13	Conclusions	208
10	FLIGHT PLANNING, PROBLEM MANAGEMENT	211
10.1	Meteorological observations, choice of routes and waypoints.	212
-	The choice of task	212
-	The choice of turning points.	214
-	The choice of start point	216

Table of contents

- The choice of finish point	217
- The choice of task length.	217
10.2 Preparation of the glider and settings: mass, centre of gravity, controls, prevention of icing on the ground and at altitude	217
- Mass.	217
- The antifreeze.	218
- Centre of Gravity Position, (CG position)..	220
- The flight controls.	220
10.3 Special Checks on the ground, pre and especially post-flight.. . . .	222
- Pre-flight Checklist (before getting into the glider).	222
- Take-off Checklist (if possible with closed canopy):.	222
- Post-flight inspections.	222
10.4 Periodic checks during the flight: airbrake lock, control stiffness (ailerons), flow and pressure of oxygen, the clock.	223
- Post-flight inspections.	223
- Control stiffness, particularly ailerons	223
- Flow and pressure of oxygen	223
- The clock and daylight	226
10.5 Common Problems at altitude: condensation and internal canopy icing, spatial disorientation, clouds closing in, wing icing.	229
- Condensation when closing the canopy	229
- The icing of the inside of the canopy.	230
- Spatial disorientation	232
- Closing in of the clouds.	233
- Wing Icing.	234
10.6 Effects of temperature and moisture on gelcoat	236
10.7 Effects of temperature on the different types of batteries.. . . .	238
- Lead acid with gel electrolyte.	238
- Pure lead-tin with internal recirculation.	239
- Lithium-ion and Lithium-Iron Phosphate	240
11 HEALTH, ALTITUDE AND LONG FLIGHTS	243
11.1 Physiological Prerequisites	244
- Dental hygiene.	244
- Ear Nose and Throat.	244
- Eyes	244
- Venous Thromboembolic risks (Economy class syndrome)	244
- Sub Aqua Diving.	245
11.2 Management of physiological problems	246
- Urination.	246
- Protection against cold, clothing.	247
- Electric heating	250
- Sun protection	250
- Dysbarism, intestinal gas.	251
- Effects of coffee or tea.	251
- Dietary advice	251
- The “Two o’clock Dip” (metabolism and biorhythm)..	252
11.3 DeCompression Syndrome (DCS) or DeCompression Illness (DCI).	253

12	OXYGEN: BASIC PHYSIOLOGICAL ASPECTS, APPLIED RESEARCH, AND MANAGEMENT OF EDS® (Electronic Delivery System).	257
12.1	Warnings	258
12.2	History of the regulations	259
12.3	Reminders of basic aeronautical medicine (simplified)	260
	a) The role of oxygen	260
	b) Reduction in oxygen with altitude	261
	c) Measuring the amount of oxygen in the blood: oximetry	262
	d) Oxygen delivery systems	263
	e) Hypoxic symptoms and the Effective Performance Time (EPT)	265
12.4	Key recommendations for handling oxygen	267
12.5	Main features of EDS and current limits	269
	- The first Mountain High® model, A1	269
	- The following model, D1	269
	- The latest model, O2D1	271
12.6	Identified problems (the manufacturer is working on them)	272
	a) The outlet pressure from the XCR regulator is not constant	272
	b) The inlet pressure to the XCR regulator depends on the length of the pipes	273
	c) The amount of O ₂ in (F) positions are not those we expect	274
	d) The “Flow Fault” and “Apnoea” alarms are often inappropriate	278
	e) In conclusions	280
12.7	Cannulae or mask, or both?	281
	a) The consequences of US regulations	281
	b) The basic mask and the cannula supplied as standard with the EDS	281
	c) Optional, but effective, masks	283
	d) Dr. Schaffner’s experiment with a reverse flow A-14 mask: demonstration of the effectiveness of expiratory pressure	283
	e) Hyperventilation: the dangers, how to identify it and treat it inflight before the accident	283
12.8	Hyperventilation, periodic breathing episodes: the dangers, know how to identify and treat it in flight before the accident	284
	a) Non hypoxic hyperventilation: stress, fear, anxiety, over concentration, phobia	285
	b) Hyperventilation following marked hypobaric hypoxia (Hypoxic Ventilatory Drive)	287
	c) Note on Cheyne-Stokes and EDS developments	288
12.9	Identification of hypoxic incidents, practical experience of pulse oximetry	289
	a) Experiments in flight	289
	b) Study of real hypoxic incidents	290
	• To chat or suffocate, you have to decide!	290
	• Urination with difficulty	291
	• Eating a sandwich	292
	• To Cough or not to Cough, that is the question	293
12.10	Conscious or voluntary, breathing deliberately against pursed lips, is necessary to exceed 6,000 m safely with a single EDS	294
12.11	RECOMMENDATIONS and CONCLUSIONS	296
	a) From the point of view of EDS settings	297
	b) Personal Attitude of the Pilot in Command	297
	c) Conclusions	297
